ImageClipper

The program is available from code.google.com/p/imageclipper. See also the author's page:
note.sonots.com/SciSoftware/haartraining.html.
I found the pre-compiled binaries to be buggy. The most recent update, from December 2008, doesn't run on my computer. The earlier update from November 2008 works. It is available in the zip file "ImageClipper.zip".

Usage

Extract the zip content to create the ImageClipper folder. Drag and drop a folder containing images on the executable imageclipper.exe. Then follow the on screen instructions to mark and clip subwindows. The result (clipped images) is kept in the subfolder "imageclipper" of the folder that was dropped on imageclipper.exe.
